## Abstract

This document is only a demo explaining how to use the template.

## Introduction

This is an example of how to use this template to render articles in the standard arXiv format. Please note that this template is still in alpha as I work out some of the mismatches between PDF output and the arXiv style.

This quarto extension format supports PDF and HTML outputs. `quarto-journals` is aiming at porting existing  $\text{\LaTeX}$  template from journals to be used with quarto. PDF format is what require the most work to fit the journals guideline, but Quarto offer a nice rendering for HTML output too. This template only uses basic HTML format without any customization for now.

## Demo of some features found in this demo journal template

### Shortcode demo

PDF are rendered using  $\text{\LaTeX}$  but it is best if one can use a Markdown syntax for cross format support.

### Code chunk

This format hide chunks by default:

But you can set `echo` option to `true` locally in the chunk:

```
# install.packages("broom")
# install.packages("kableExtra")
m_pois <- glm(Days ~ (Eth + Sex + Age + Lrn)^2, data = quine, family = poisson)
kableExtra::kbl(broom::tidy(m_pois))
```

### Using references

I did not read this book (Cameron and Trivedi 2013) but it must be interesting
